

• AVATAR RUNTIME

A character in the browser, driven from **outside** it

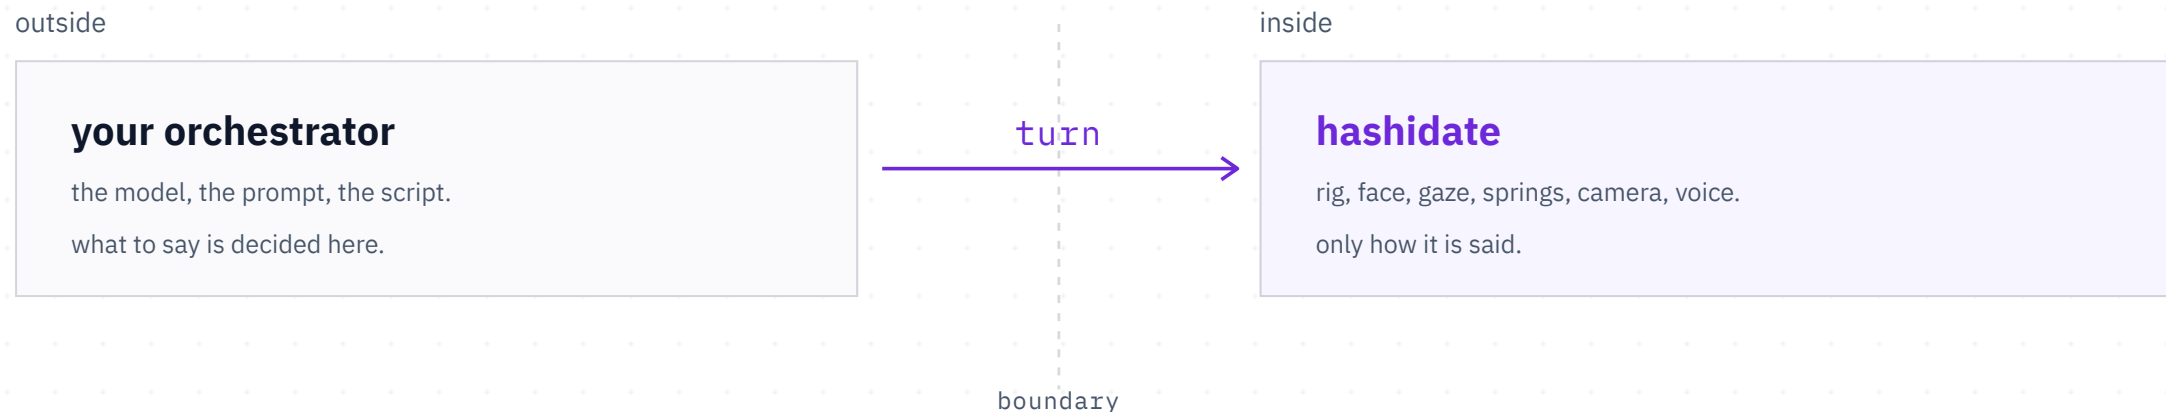

hashdate takes on how an AI VTuber looks, moves and sounds — and nothing at all about what she says. The caller holds the script; this side holds the character.

libraz

Where the line is drawn

01

This line is the product. No model SDK, no API key, no prompt and no conversation state exists anywhere to the right of it.

💡 One turn crosses, and nothing else. That is what makes the runtime worth keeping separate from the application above it.

Who wrote it

02

libraz

Tokyo / libraz.net
github.com/libraz

WORK

Software engineer since 2001. Currently on **identity (OIDC) and payments**.

BUILT

libsonare — a C++ library for audio analysis and real-time audio processing. The same engine is called from the browser (**WASM**), from Node and from Python.

libcantus — a TypeScript library for harmony and temperament. It builds chords, reads keys and writes voices. It never touches sound itself.

sonare studio — a **DAW that runs in the browser alone**, built on those two. Nothing to install.

ALSO

Runs an idol agency. **That is most of the reason the open source is about music.**

THIS DECK

What the runtime draws, and what it refuses to know. Not covered: the orchestrator above it, or whatever writes the lines.

💡 The character reading this page is the runtime; the words are somebody else's. That is the whole arrangement.
